Help, I need a wrinkle brain to let me know why my questions are dumb and why these are bad ideas. Thank you and smash away! Feel free to copy/paste into other subs.

1. What if we found out who the enemy's investors are? It's not like there's a lot of them. There's like less than 2 dozen right? We know from filings that they're already pulling out funds but what if we help accelerate that? What if we found out who they were? We have flight records as hints right? If we found out who they are and give them an abbreviated DD explaining the futility of the enemy's cash burn, I bet we can give them an honest convincing argument of our case to pull out and reinvest in GME. We can also let them know all the other investors are receiving the same information and we all know the last one to pull out will be holding the worst returns of their investments. Seems like we should target this small audience and reach out to them.
2. What is the deal with targeting teacher's pensions? Don't they know that teachers are a more educated and logical group? I believe if we laid out an abbreviated DD with this target audience in mind, they can come to the same logical conclusion as us. Heck, if I was a teacher and knew my pension was on the opposite side of a GME position via a swap, I'd invest in GME to hedge against the risk of losing my pension.
3. What does the interest rate to borrow GME tell us about the enemy? The interest rate is over 100%. The interest rate may not be exactly accurate but for the sake of complicating the math, let's say it is. What does that tell us? This interest rate means that if the stock costs \$100 to buy, it will cost \$100 in interest to borrow over the span of 1 year. It makes no financial sense to borrow a stock at 100% interest rate if you borrow for over 1 year. This means that the enemy's financial analysis, algorithm programmers, and all the smart talent they have have concluded that they're going to borrow this worst case 1 year. What am I missing? Doesn't this mean they know the end is coming in less than 1 year. Is their cash burn calculations less than a year? Do their moles at Gamestop know that the end is gonna trigger in less than 1 year? What do they know that makes it worthwhile to borrow instead of buy a share? They know something is happening in less than 1 year. I don't know what but if they're borrowing knowing that it's cheaper even at 100% then the end is near. Worst case 1 year, right? Rocketship!
4. What if there's a NFT dividend? Let's say it's just a gif. I know the NFT technology does much more but let's talk worst case scenario. Let's say it's just a gif. There will be 2 Rocketship's right? One for the stock and one for the NFT. Let's focus on the NFT Rocketship. There'll be one GME holder that is a loser, right? Let me explain. Gamestop distributes to Computershare. Computershare distributes to DRS hodlers and Cede and Co. Cede and Co and/or brokers will have to divvy up these NFT's to everyone but they don't have enough. They'll distribute as many as they can then they'll try to buy them back to give to the others. Rocketship for the NFT happens. DRS hodlers end up selling their NFT for millions at the end of it and finally Cede and Co and/or brokers have enough NFT's after buying the same NFT's over and over for everyone who gets a turn and finally buys the last one. They give it to the last GME holder. Then that's it. No more buying pressure. The one poor GME holder can't sell his because no obligation is due to anyone else. They won't be able to sell their's for shit. Remember how voting ballots got distributed. All the DRS hodlers got theirs fast. Everyone else had to wait for Cede and Co and their brokers to pass them out. The NFT dividend will be the same. Don't be that loser. DRS!
