Is\_self: True

As Apes shake the tree for more tendies and hold them all in one basket, securing said tendies becomes a higher priority.

I'm wondering if anyone has strong opinions on best practices for password management.

1) Is there a consensus best option for password manager in the Ubuntu/Linux environment?

2) Do you trust password caching in the browser (Brave/Dissenter)?

I'll always backup on paper, but typing all these digits by hand is error prone....so I'd like to allow the computer to computer if it's safe.

Cheers!
