The DAO is one major invention that is challenging current systems of governance. Utilizing NFTs, DAOs are changing the perspective of how organizations and systems should be run, and they promote further the idea that the optimal form of governance does not have to always revolve around hierarchical structures.

With the principal-agent problem limiting the growth of organizations and preventing agents from feeling like part of a team, you can see why the need for decentralized organizations fostering community-inclusion is essential.

Is there something you would change about the organization you're working in right now? The structure? The payment system? What if your if it was feasible to feel and be more seen, more heard in your current organization and play a more valid part in it by reducing the disparity between the principals and staff?

But let's take a step further what if you had the chance play a part of in your organization's governance? This is what what DAOs can bring forward if implemented correctly. And seeing how recently the largest treasury in the crypto market has become bitDAO the DAO adoption is is being more and more implemented everyday.

The autonomous structure of DAOs makes them open to transparency. The concept of decentralization has fostered the idea of trust and, with DAOs, you don't need to be worried about the people behind the organization and whether or not there's an ulterior motive. The template everyone is judged by is the smart contract, and every transaction is immutably recorded on the blockchain, no more late pay days, no more delays, everything is blockchain encoded.

As Vitalik put it: "Most companies are likely to buy into the DAO system as it helps to reduce operational costs and improve the bottom line of these companies' finances." DAOs are going to be a big part of the future and we're seeing that begin in the present year.
