

Title: Would Starlink be a direct competitor of the HFT fiber lines connecting various exchanges?
Thoughts?

Fiber internet connection's latency speed is around 17 ms which is a bit faster than cable. But, Starlink on the other hand has an expected launch date of its new low-latency service that will have speeds below 20ms and eventually reach 10ms or lower in near future – making it one of the **fastest with bandwidth** as well.
