Why I think we won't moon until mid next year:

Check the video at 3:55. "The unemployment rate peaks after the S&P; bottom". The white line is the unemployment rate and even though it squeezed during 2020 covid, it went back down due to money printing. That white line (unemp. rate) will have to spike again (it hasn't yet) and it could be between EOY XMOASS, or more likely, mid next year to next year's christmas, given how the US economy despite the macroeconomic outlook, is still refusing to collapse. Even almost 10% CPI and still no collapse

The S&P500; in the green line is still near the peak. We have a long way to go for it to bottom. The 2008 crash didn't happen straight away, it took years.

Wake me up next July wen the US economy is on its last legs and maybe we're still trading sideways at \$33.

We need the stock market to collapse so maybe hedgeie's collateral will all go down and they'll have to close/cover their short position, igniting the rocket

wen economic collapse
