

Title: What do you think is going to happen if the price dropped to \$50, or say even \$30?

Hear me out before you go all bananas on my ass. Reading the MSM one could lead to believe that the GME split is a bad thing (putting aside for a second why they are singing that opera right now, we all know it won't be over till the fat lady sings). I read a bunch of BS about that the fine print doesn't include any details on the ratio or other pivotal information, or how increasing exec share pool from 6.3 to 8 mill would dilute the value cuz they WILL be selling (completely ignoring that stock packages usually come with stipulations such as a vesting schedule that tends to be 4 years, or RSUs with some rules attached such as you must meet goal xyz before you can pull the string on your golden parachute).

Now, say with a split the price drops down to something below \$50. I go out to venture that we'll see some massive buying spree from a bunch of retards that are used to seeing \$74 one day, and \$168 two days later. I for example am waiting for the split to drop the price into the lower double digits so I can start flinging shit and buy as many as I can before it goes into the triple digits again. That idiot behavior alone I think will be a catalyst to drive the price back up rather quickly.

Will the hedgefucks do anything they can to suppress the price at the same time? Sure, but I have time on my side.

And please, some wrinkle brain correct me. The way I understood the issuance of dividends with the split could cause the price to stay where it is, but some shortseller dimwhad is on the hook for short+x shares, meaning his margin requirements just became margin/x.

Example: you are on the hook for 100 \$shares @\$29 with a margin requirement of \$3000 (u got \$100 wiggle room). Now with the issuance of a say 3:1 you are on the hook for 100+300 still @ \$29 but your margin requirements stayed the same @\$3000 =fucked.

BUY - HODL - DRS - RINSE - REPEAT
