Hedge funds are seeing increased volatility with ITM options and GME stock price. If you're them, what do you do? I think this was a controlled run up, allowed to shake out profit takers at the lowest possible price. I wouldn't be surprised to see this happen a few more times - controlled run ups to defined price points, followed by massive bid manipulation in order to A) settle low-profit gains, B) scare off paper hands when they see a drop, C) purchase shorted shares with real shares being reintroduced to the market. Anyone care to elaborate on why this isn't a likely explanation?
