Hey all!

I am new to investing, don't know a lot and the theory I have may be earth shattering to the squeeze or just dumb. I honestly don't know. If it is counter productive to our movement, then please let me know.

We all know we own the float and many of us only own synthetic shares. During the squeeze, as it has been explained to me, the hedgies will be buying back through piles of synthetics trying to get to actual shares so that they can then put real shares on the open market again and put real selling pressure on the stock.

Stick with me.

What if we never sell our real shares and only sell the synthetics back to them. Holding off on selling our good shares?

How is that done?

I can't be the only one with multiple brokerage accounts and one that I have been holding GME since the start of this thing. In my first account there must be those valuable legit shares. But in my second account that has only been open for about two months now, those must all be synthetic. So when the squeeze happens, if I bracket out using my synthetic account, theoretically I could start cashing out and not negatively effect the squeeze and then ride my good shares to the top...or at least closer. Am I right or wrong here?

If I am right then anyone who is holding good shares is a key player in making this ride high for everyone involved. Not just ourselves. And if you have a "synth-account" dump the thing and get the money when you feel comfortable, but hold the "legit-account" till it's at crazy highs.

This isn't financial advice. I am simply telling you I don't know what I am talking about and either want people to tell me that or tell me I am some accidental genius! Whichever is more deserving I will take with pride.

Taking it more slow and calculated like this, we may be able to make more and bleed the squeeze.
