Today I ran out of TP and had to wipe with napkins from McDonalds, the same napkins I use to do my math for stonks, so don't take anything I have to say seriously. This is not financial advice.

It looks like we are still seeing the trend of less volume in the short pool and more volume in the lit markets. The 5 day MA for lit markets and dark pools is sitting at 66.9(..6.9 huh huh) lit and 33.03 dark. The pre-CS migration average was between 50 and 60% lit and 40 and 50% dark.

I did notice a funny thing while noodling with my charts... To my untrained and ignorant eyes, it looks like there might be a correlation between a run-up ending and a spike in dark pool volume by %. Don't know what the implications of that might be, and it hasn't happened every time. Seems almost as suspicious and my ex-wife's 'girl's weekend' in Vegas with the guy she told me not to worry about. Or it could be something totally natural that I just don't know about because I've only been looking at the stonk market for a couple of weekends, eg noise.
