6. Brokers that lent shares now have a CNS negative balance.
 - a. They can borrow shares from some other broker, this continuing a game of hot potato that may never end. This could be an end to all the action. Brokers continue to borrow from each other developing a cycle that minimizes the pain to all until apes get bored and sell.
 - b. Brokers who have negative CNS balance because of lending, could buy shares, but where would those new phantom shares come from?
 - i. They could also buy from the lit market. Maybe MDASS. Maybe just a run.
 - ii. They could buy in the dark pool, but still just passes the share obligation.
7. A larger financial entity could place an options order for call options and put options, and immediately exercise the long call.
 - a. This creates a synthetic long position that they can then sell in the dark pool to the broker who has a negative e CNS balance
8. The larger entity then creates a swap with a bank that hides the option positions and short interest since the CFTC is currently eating a bag of dicks.
 - a. And this is most likely how the available chain of events end. Not with a bang, but with a swap.
