

Title: Once ComputerShare DRS all outstanding shares there will be no need to ever sell. Does my reasoning make sense?

Once the entirety of officially issued GME shares have been DRS with ComputerShare this basically equals the infinity pool. All remaining shares residing with brokerages will be synthetics.

1. Shorts must buy all synthetics (hundreds of millions) to close.
2. Price will not peak and then fall if registered share holders just hang onto their DRS shares. Just continually up until the last synthetic is sold. This last sale will set the market price.
3. If DRS shareholders just hodl those shares they can be used as leverage/collateral to borrow against. DRS shareholders can simply borrow a few million dollars against their holdings, invest in other assets that pay dividends or appreciate enough to cover the cost of borrowing and still have enough to make their families and their children's families wealthy for generations.

Makes sense to me. Am I failing to consider anything significant?

EDIT: Not financial advice
