quick lesson on using the proper platform ■s, I attempted to move coins from layer 1 to layer 2 via the kiwi browser Android work around (you can download the wallet extension on your android phone on Kiwi) it works well enough I was able to buy Eth on Layer 2, I was able to swap from Eth to Loop on layer 2 and I was able to move that loop from layer 2 to layer 1, I can also confirm that sending coins into and out of the wallet works fine, the issue starts when you want to go from layer 1 to layer 2, it's the only thing I've found that didn't work, I payed network fees for the move I got an approval in my activity but it didn't actually do anything, I had to redo another layer 1 to layer 2 move on an actual PC and it worked fine.

TLDR if your using Kiwi or another work around for the GameStop wallet don't move coins from Layer 1 to Layer 2 you will pay and get nothing, use the official chrome PC browser, for anything else it works but there's still a risk as its not the native browser it's designed for.
