In the last 2 weeks we have noticed a gradual increase in trading going to the lit exchanges away from the dark pool trading.

If we assume that this is caused entirely by apes transferring shares to CS, we can estimate how many shares have been moved.

Before Sept 14th the average Lit exchange percentage was 57% and after Sept 14th it has been 65%. Again, we could assume the difference (8%) is caused by apes using CS.

8% of the trading volume over the last 2 weeks has been about 2.1M shares or about 200,000 per day.

This is in addition to everything that was transferred up to that point.

It would be nice to see if anyone could poke holes/improve the theory.

Inspiration came from u/stonkkingsouleater:
