

Title: If an infinity pool is confirmed to exist (perhaps through DRS with ComputerShare) how would the price ever drop from MOASS peak?

Wouldn't it just keep going up until the trickle of sellers dwindles to a halt and then just stay at it's peak?

Assuming there's a way to confirm an infinity pool, such that those shares are verified to be virtually untradeable, GME reaches another galaxy and just stays there, right? Not so much a squeeze with a peak followed by a drop back to earth, but just a peak.

Please help a smooth brain understand.
