The activity at Computershare seem to be increasing the volume on NYSE and decreasing the volume of dark pools for GME since about 25 September. Here are those two data sets plotted with 2-day moving averages and trendlines in excel.

<https://preview.redd.it/kaqwra558tr71.png?width=904&format=png&auto=webp&s=f0e53e6ef6b8ff381e05d28308b0e5dcecb14bc>

The blue data with green trendline is NYSE Vol % and the red data with red trendline is Dark Pool Vol %

Notice that the Dark Pool trendline has $R^2 > .60$ which is good. The NYSE trendline has R^2 about .35, which is not good. However, if we drop that one blue dot way the fuck up there in the red's area, then the R^2 value jumps up to .61, which is good.

Each trendline is extended 20 trading days (about a month).

TLDR: it is fucking working!

buy, hodl, and TRANSFER --

yes, you!

yes, right now!

it doesn't matter if you only have a few shares
