When \$GME shorts are forced to cover after the stock split, what would the peak price realistically look like? I hear a lot of crazy hype about it reaching a price of \$20 mil or \$69 mil per stock but I'm not sure how that is anywhere near realistic given that no stock has EVER gone that high.

Does anyone have any idea how this might actually play out? Is \$1000 or \$10,000 per share after dividends actually likely or is this mostly an exaggeration?
