I was high and drifting off to sleep last night when I had a thought: what would a GME share valued at infinity actually look like?

Naturally this is predicated on our beloved pool filling up and anyone only selling one share for phone numbers to be set.

The thought experiment went like this. Party A has an asset worth infinity dollarbucks. What can you buy with infinite money? Literally anything, right? So party A needs, idk, consistent supplies for a project they're working on. So with this infinite asset they purchase from party B a lifetime supply of whatever materials they need for the project.

Now party B has an infinite asset and they're contractually obligated to supply party A. So with an infinite asset they can purchase from party C the same unlimited supply of whatever to match whatever they're providing for party A.

Party C now has the infinity stone, then party D, then E, etc etc. And it would seem to me that with infinite purchasing power at some point there's be an equilibrium where the parties all have an infinite supply purchased with the asset, all parties are satisfied, and all parties are taken care of.

Thought ends there, and I'm not an economist by any stretch of the imagination. Too the moon y'all
