Sorry if the Request flair is wrong. I didn't see a question flair, so I assumed this would fall under the guise of RFI...

I read an extensive DD on CS written by someone to help pretty much anyone know how to get their shares over to it, what to expect once there, etc, and it was a big help save one detail.

They discussed how- since it is not a broker and the UI and service are different- an order may not go through immediately. OP even made a point to say "they're not great at selling." Then they went on to say that per their own experience, when they put in orders, they saw these orders were already filled when checking back in 10, 20 or 30 min.

But... once a major peak breaks, dips can come on fast. even 10 min is an eternity. does anyone have any experience in just how long it would take for an order to go through.? E.g. if the time comes- maybe we're officially on the way back down from whatever peak- and I put in a sell limit order.... what is the danger that this order may not be entered in time, and the sell limit price gets passed by. To my understanding (and by all means, correct me where I'm fucked up), this would mean my sell limit order would never get filled as the price kept dropping, possibly at break neck speed.

Is this something we need to be concerned about.

OK thanks. Peace. And Hold.
