I'm pretty smooth brained and maybe this would be market manipulation I'm not sure.

Couldn't Gamestop release an extra 10% of their float as new shares into the market as a capital raise, specifically to give a dividend to their share holders for that amount?

So let's say they currently have 70million shares floated @ 200 / share, dilute that by 7 million shares, let's say it's now 180 per share, now there is 1.26billion raised. Give that as a dividend to all share holders. That's a \$18 dividend (%10) but a wash if there is no short interest. Now, we know shfs have shorted 200% or more of the float. They now have to pay out \$2.5bill in divs to the hodlers on top of the 1.8 bil paid by Gamestop. This results in more \$ in divs than the cap raise, pushing the price up because you're making more \$ to shareholders than your dilution off the shorts in dividends. Rinse and repeat until marge calls. We all get rich on dividends until we get mega rich on the moass. What true hodler wouldn't vote for that dividend plan?

Please explain where I'm wrong.
