Hello Apes,

That's right DD number three in two days, but this time it's not mine.

As some of you know I got a group of people together, that some of you refer to as my "quants", a little over a month ago. We have been diligently working behind the scenes to solve some of the fuckery surrounding GME and the other meme stocks correlation to GME.

Most of our research is still very much waiting to be confirmed.

**\*\*However\*\***

This piece in particular is pretty time sensitive so we decided it was best to go forward and release it now as it is an imperative follow up to yesterdays [Buy & Hodl DD]([https://www.reddit.com/r/Superstonk/comments/pj90o7/buy\\_and\\_hodl\\_the\\_guide/](https://www.reddit.com/r/Superstonk/comments/pj90o7/buy_and_hodl_the_guide/)) .

# All credit to my secret pickles, a Dan, and u/Dr\_Gingerballs

Without further ado...

A taste of some "secret DD"

# Revisiting T+35: Why It's Still Important and Why It's really T+69

Hello, fellow apes. I realize you are probably rolling your eyes at another T+35 post. Didn't that theory crash and burn multiple times already? Well, like the putrid remains of the delisted zombie stonks, I think it's important to raise this theory back from the dead one more time to discuss the mechanics of settlement, how this results in settlement periods much longer than 35 days, and what that means for those who buy and hodl this magnificent stonk.

tl;dr: buy and hodl

The inspiration for this post comes from a paper written by a researcher in Australia back in 2009 about the mechanics of clearing and settlement in the US. [You can find a free version of the paper here]([https://www.researchgate.net/publication/228260887\\_Naked\\_Short\\_Sales\\_and\\_Fails\\_to\\_Deliver\\_An\\_Overview\\_of\\_Clearing\\_and\\_Settlement\\_Procedures\\_for\\_Stock\\_Trades\\_in\\_the\\_US](https://www.researchgate.net/publication/228260887_Naked_Short_Sales_and_Fails_to_Deliver_An_Overview_of_Clearing_and_Settlement_Procedures_for_Stock_Trades_in_the_US)) (although I'm sure many of you have already found and discussed this). Specifically, this quote caught my attention (emphasis added):

"An algorithm run by the NSCC determines which of the participants with long positions (participants that are owed stock by the NSCC) due to be settled that day will receive stock. **\*\*The algorithm works by allocating shares in the following order: priority groups in descending order, age of position within a priority group and random numbers within age groups\*\***. Participants can request that they be given priority to receive stock on a standing or override basis. Also, participants that submit buy-in notices (requests to receive stock owed to them) receive priority with buy-ins due to expire that day given priority over buy-ins due to expire the following day, which in turn are given priority over priority requests and priority overrides."

Essentially, the NSCC allocates the trade of real shares TODAY to previous buy orders that are about to be listed as fail to deliver. Now when it's only T+2 or T+3 this isn't super interesting. However, if someone is given [T+35 calendar days to settle their trades](<https://www.law.cornell.edu/cfr/text/17/242.203>) (about T+21 trading days), a significant amount of manipulation can occur within this system to hide a large and

Now at this point I'm sure that everyone wants to know what's going on this cycle. If we assume a similar exponential decay in volume from 21M with a time constant of 17 days, and assume a constant short volume of 55% each day, FTDs appear after 42 trading days with about 100M shorts packed into the chain (at least 50M of which are naked). Certainly not as high as the last cycle, which may explain why we haven't soared as high this time in the run up so far, but still a huge short position. Now this analysis does not include any nefarious activity surrounding ETF baskets and the options chain, nor does it factor in the effect of the share offerings, all of which would increase the amount of shorts that could be hidden from view. Nevertheless, I estimate a minimum of 50M new naked shorts have been pumped into the system this cycle. As of this weekend we have seen about 52M in volume during this runup, with an average short volume percentage of 55%. This means they might still have around 25M more shorts to clear before this cycle ends to avoid FTDs.

Now does this mean that T+69 explains all of the behavior we have seen so far? Not quite. I believe that they are timing their shorting so that the FTDs appear at a convenient time. For example, suppose they are using futures contracts and/or swaps to establish the net long position they need to receive the T+35 settlement time ([OTC derivatives with expiry dates longer than 3 months carry net capital calculation penalties so they could be using quarterly swaps as well as quarterly futures])(<https://www.law.cornell.edu/cfr/text/17/240.15c3-1>). They need to start rolling these to new contracts a few weeks before they expire, at which point they lose their T+35 benefit. If they short too hard, the FTDs crop up too soon. If they don't short hard enough, they risk the stock gaining positive momentum. So they short it just as much as they can based on the amount of legitimate daily volume to drag the FTD cycle to their rollover date.

So what do we do? By now everyone on the planet sees the obvious quarterly boom/bust cycle that we are in. I'm sure a lot of you are thinking that you will try to day trade the peak this week. Hell, I know I've thought about it too. But the key to this entire mechanism I've proposed here is LEGITIMATE VOLUME. They need real transactions to occur to give them the flexibility they need to pack the pipeline with naked shorts. If nobody sells, they just continue to dig their own grave. Many of us have been through 3 drops now, and most of us hodled every single one of our shares with the diamond hands memes are made of. Buy and hodl is working, and it's working better every day.

I think if we don't simply MOASS this week and go one more cycle, our volume will become so dry that the whole grift will burst with the might of 1000 suns within 69 days of earnings. The SHFs aren't stupid. They know we see the cycle, and you can bet they will use that against us to get us to do the one thing that can save them: paper hand.

**\*\*Don't fall for the FUD.\*\***

Now is our opportunity to show Wall Street what happens when a bear attacks an ape.

**\*\*Buy & Hold it's what Guybrush would do...\*\***
