Hi everyone,

I believe that our thesis is that the shorts never closed. Is there a relationship that can be explained between being short variance and being short GME? Are they the same somehow? Certainly you can enter a short position without being short variance. I assume you can be short variance without being short the stock.

I also don't understand how them being short variance has anything to do with us? I'm not long variance I don't think. I'm long GME. I get that whomever is short variance could be screwed when RC executes his plan, but how do we make money off this?

I guess my real question is now that the DOOMPS are gone, other than the ETF's, where are the shorts?

I'm long on GME for half a dozen reasons. I wholeheartedly trust RC, their new hire list is truly awe inspiring, their lack of leaks shows true leadership, Matt Finestones letter when he left LRC, paid promotion for "shorts closed their position," the list goes on and on.

Cheers y'all!
