(maybe this was answered before but i didn't find it) Is there no rule or equation available that would make us understand exactly the mechanism of the short borrowing % ?

I feel like we could come up with a general formula to link it to DRS volume if we knew exactly how the borrowing rate is made up

Or at least help making correlations.

Hopefully we could see how DRS % is directly increasing borrowing rates, convincing other apes to make the final step.

I was lurking around for a long time (and beeing lazy) but I started the DRS process with the dividend fkery

(Mandatory GME, Moon tomorrow)
