To preface this post, there are a few things that must be said so that I don't get shilled, and so you know where I'm coming from. How I reach my conclusions, and why I think the way I do.

1. Anybody who thinks they can predict intraday price movement in a stock is just yanking your chain. Even weekly price movement is hard to predict, just like the weather, the more vague, the easier it is.
2. The stock market and more-so derivatives is all a scam. Once investment banks and deposit banks became one, the ruse just became more mainstream
3. Everything is connected and there are no coincidences.
4. Lastly, I'm a constant lurker on this sub and other GME-related subs. I will reference many popular posts, but not provide links. If it really bothers you, comment it and i'll try my best to pull up the post proving my information correct.

Sooo there was a post a couple days ago (tuesday? wednesday) that basically said the Elliot Waves is predicting the bottom of this next wave or what not at around \$202, or something like that. As I'm writing this post I have watched (quite numbly) GME drop 6.5% or around \$14 to ~\$199. At this point I firmly come to my first conclusion from above. Intraday price movement is unpredictable. I more-so firmly believe in following patterns and trends of green/red days which i'm experiencing to be a bit more reliable.

I think the better question being asked is why the stock is moving in whatever direction it is moving in. Here is where the theory aspect of the title comes into play.

This week we've seen numerous articles referencing GME and it's undeniable potential breakout, along with posts regarding the beautifully crafted gamma ramp that was created. I believe we started seeing that very gamma ramp start going into effect on Wednesday morning right at open. GME jumped to a nice \$230 before being hammered back down to the \$210s. Now we are seeing GME being hammered down even more, which is just in line before the end of the quarterly swaps breakout.

That leads me to my next point.

The news articles are going to falsely promote GME, well not exactly falsely promote it, but prematurely. GME is set for a breakout, but they promoted it just a tad early. With Criand's DD, we know that GME is going to peak next week, have no idea how high, but basically what i'm trying to get at is that the price movement is manipulated within the cycle, with breakouts at the beginning and end. So although GME is down to \$200, it would be within the cyclical pattern for GME to have some heavily green days that pump it to \$300+.

I think there are lots of posts that explain why day trading is bad, but to hammer it in there, you can only predict so much based off of historical data. The SHF could say fk it and cover earlier than expected, or wait until the very last moment to cover (like usual). They choose when to cover (/rollover swaps), but the inevitability of it is there. Anyway, I can't remember the last couple cycle's patterns, but something very apparent and I'd assume purposefully obvious is that we always pump at open. Regardless of a green or red day, we have consistently pumped at open and that's on purpose, to entice day trading, and to get you to miss out on the real pump.

TLDR:

- * Basically my rambling has hopefully left you with these conclusions:
- * SHF will over the swaps when it benefits them the most or hurts them the least. (When the impending doom of a gamma ramp) since multiple days at \$300+ is a lot scarier than days in the low \$200s.
- * Everything is connected, between old companies being pumped in OTC markets (SEARS, Blockbuster), to the inevitable MOASS.
- * Day trading is a big no no since nobody can predict exactly when they will rollover swaps, or cover. Though you can look at historical data and hypothesis when.
- * With the mindset of the price being wrong, you shouldn't be disappointed when there are red days. In the end you will have commas and lots of green.

Thanks for bearing with me for this rant. There are 2 things that are certain and inevitable in life. Death and MOASS.

Have a great weekend everyone, stay safe, and enjoy Labor Day.

This isn't financial advice,
