If there are 25 million shares left worth roughly \$2.5 billion dollars, and Gamestop is the only publicly listed stock with an NFT marketplace, how much of a scramble will there be to gain exposure?

I was thinking about Tilray, which was the first publicly traded weed company listed on the Nasdaq exchange. It opened up at \$17 dollars a share and went to \$218 dollars a share in two months as investors and funds scrambled to gain proper exposure. The same thing could happen with Gamestop. There is no other company right now that is publicly listed which offers exposure to NFTs.

There are a number of differences between Gamestop and Tilray, one being the number of shares Tilray offered was 9 million, far less than the current 25 million Gamestop has. But at the same time, there were still a lot of other weed companies in Canada that could be invested in to gain exposure.

Another is Gamestop isn't 100% an NFT company, so 1 share does not equal 1 unit of exposure.

But still, Gamestop is the only company offering this, and if everything about the short interest being above 100% is true, things could get interesting when the NFT marketplace is up and running.

So really, as shareholders, we may want the stock price to drop more and more in the short term. This would allow more shares to be taken out of the system, which would make it harder / more expensive for funds to gain exposure the this new technology when it goes live.
