

Title: The move to Computershare seems to be sucking volume out of the dark pools.

Huh huh... suck...

Computershare can only trade on the NYSE which is a lit market. Since the migration to Computershare, dark pool traffic has steadily decreased and lit market traffic has steadily increased.

I'm not sure if this is just reflecting a spike in traffic being caused by shares moving to CS, if this reflects a decrease in the number of shares available to trade in dark pools, or a combination of both. At worst, this is a sign that apes are moving the needle via their transfers, but I don't know if its permanent or a sign that liquidity for badguys is decreasing... though it could be, and if it is then 0% dark pool traffic might be a sign that the MOASS is upon us, and this data point would suggest that we're about 25% of the way there. Just speculation though.

Bottom line is that the CS migration seems to be doing SOMETHING and it might benefit apes to keep going.

I'm going to go eat some crayons for lunch now. Not financial advice because I'm just a dummy.

Edit: Oh yeah, forgot to mention, the data comes from here:
