I'm currently running my data collection (pulling from various APIs) and data processing on a local Ubuntu machine but that's not really scalable unless I'm constantly moving the data to an external drive. I want to move to the cloud to fix this and I'm looking at AWS products which I'm kind of into, but I just wanted to know if when anyone else did this, they didn't like AWS or found a better provider. Also cost is kind of a factor, and I'm not looking for simply running a VPS.

Edit: I'm looking at Glue and s3 (because s3 is cheaper than a full on dataset from my understanding) I'd appreciate if someone could tell me if I'm backwards
