On March 15, the Federal Reserve announced its decision to raise interest rates by 25 basis points, and the swing shoes finally landed. The Nasdaq started to rebound, and it took the Nasdaq three weeks to gain 13.58%.

At the same time, GME has also started its first capital drama in 2022, and we will share them one by one. If there is anything wrong, please forgive me, thank you! (This time, I'm assuming the party driving up GME's share price is called the "institution")

■ GME stopped falling on March 15 and rose slightly for 5 consecutive trading days. The trading volume has gradually increased, and institutions have hoarded a lot of chips.

(The reason why it started to rise sharply after a small rise for 5 consecutive days indicates that the institution did not have enough chips before)

■ On March 22, GME surged 30.72%, with a turnover of 15.02 million shares, a turnover rate of 19.67%, and a turnover of US\$1.73 billion.

■ On March 23, GME surged 14.50%, with 24.6 million shares traded, a turnover rate of 32.22%, and a turnover of US\$3.43 billion.

In the next two trading days, GME's gains became smaller and trading volume became smaller.

(The reason for the small gains for two days in a row, I guess is that institutions want to attract more investors' attention, so as not to sell the stock when there are not enough investors to take orders)

■ On March 28, GME rose again by 24.77%, with 16.23 million shares traded, a turnover rate of 21.37%, and a turnover of US\$2.78 billion.

■ On March 29, GME pretended to rise twice, and finally fell -5.11%. 18.01 million shares were traded, with a turnover rate of 23.59%, and the turnover reached a recent peak of US\$3.26 billion.

■ It can be seen that at this time, institutions are selling a lot of GME stocks, and many retail investors who follow the trend have become foodies. Meanwhile, on March 29, GME rose to a high of \$199.41. From \$77.58 on March 14 to \$199.41, GME has gained \$121.83 ■, or 157.03% ■.

At this point, the institution has made considerable profits. The agency may have sold a substantial amount of its own stock.

In the following two days, GME continued to decline slightly, with both share count and turnover falling. At this point, institutions are still selling stocks.

■ On April 1st, GME opened at 13.19%, giving people the illusion that the market price was rising, and there were many false rises at noon. 13.19 million shares were traded, with a turnover rate of 17.28% and a turnover of US\$2.275 billion.

Maybe my commentary analysis is wrong, but I just hope that I can summarize some experience for everyone with the help of classic trading cases.

What do you think about this? At what price did you buy GME stock? What are your thoughts on the future of the stock market?
