Superstonk is likely the more (in)famous GME subreddit. However due to shilling, they've created a karma requirement to post - I think it's like 500? Anyway, I am posting here because **I don't have enough karma to post in superstonk**.

Since u/DRSBOT has been recording SuperStonk users DRS'd shares, we know both 1) how many users have posted their DRS activity and 2) the number of shares they've DRS'd. However, all along we've known this is a likely undercount because of apes not on SuperStonk, ape ambivalence, or apes unable to post.

I believe SuperStonks karma requirement and the DRSBOT have setup a **natural experiment**. FIRST, we have 2 mutually exclusive groups that make up SuperStonk: users with enough Karma to post and users without karma. SECOND, we have DRSBOT data, but only from users with enough karma to post.

If we were able to analyze the karma of all subscribers of SuperStonk, we could start to answer the question: about what percentage of apes have DRS'd?

Looking for feedback to see if this is reasonable approach to take. If so I will look into gathering the data.
