I have taken these two screenshots on Webull on two different days showing the percentage of gme profited shares at market close.

On the 20th of january that percentage was 0%. The closing price was \$102.67.

[Percentage of profited shares at market close on the 1/20.](<https://preview.redd.it/k1n4uitn41e81.jpg?width=615&format=pjpg&auto=webp&s=c5d1723ccbdb8716822dacb39a9966a39c00730>)

Yesterday that percentage was 13% with a closing price of \$99.79.

[Percentage of profited shares at market close on the 1/25.](<https://preview.redd.it/xzedqi8t41e81.jpg?width=615&format=pjpg&auto=webp&s=fce4b56f213b04f94dcb9d28e4016ce224df279c>)

How can this be possible? Does this means that people have bought at a price inferior to \$99.79 in this five days and those shares purchased are now profitable?

Did people bought the equivalent of 13% of the shares outstanding that is $76.49 \text{ mln} \times 0.13 = 9.9437 \text{ mln}$ shares in between these days?
