Why is quantum computing so exciting?

It means limitless possibilities, literally. Scientists have long predicted that quantum computers could tackle certain types of problems — especially ones with a high number of variables and potential outcomes — much faster than any classical computer. Now real proof is appearing.

How might quantum computing benefit asset management?

It's all about edge. The best hedge fund strategies are based on decoding markets and finding the invisible profitable patterns. Finance is often about solving issues that have probabilistic outcomes, like portfolio optimisation. So imagine if you could determine in real time the best possible basket of various assets and securities for any given shifting market environment?
