Lets stick with the theory that 1 stock turns into 4 stocks but this has no impact on the shorts because they just start up the synthetic printer to spit out more shares and brokers just multiply your count by 4 and display that number of shares on your screen while dividing the price by 4.

We trade sideways for a month and nothing happens to the price. Shorts are confident as fuck they have done it again. Kenny goes back to chugging mayo using a boba tea straw.

Now remember the share count went from 76 million to 304 million.

Also remember that GME is one of the only companies out there that is shorted above 100% of the float and is working on a Crypto wallet and NFT exchange.

Also remember a company O Stock who has nothing to do with Crypto released a crypto dividend to squash shorts and have the price shoot up 17x in 4 months.

A person who has a billion dollars in stock in a company (RC), takes a pivot to technology / web 3.0. Builds a wallet, marketplace and gains hundreds of thousands of loyal customers / investors in the process.

You think someone would have a billion dollars on the line and not have a plan to remove the numbnuts who have been shorting his investment since before he got in?

You really don't think the company would delight shareholders by giving them a non fungible token which can't be copied / created or can be kicked? They spent millions building a marketplace/wallet and hiring folks to make it happen. What's the best way to bring a ton of natural traffic to your marketplace?

This token will be traded on a marketplace that is about to be launched and will have natural volume from their own shareholders who are also their most loyal customers.

RC knows exactly what he is doing. Increase the share count exposure for the shorts and then releasing a non fungible token tied to each split share. Now imagine releasing a non fungible token each time you want to delight your shareholders and reward them instead of traditional cash dividend.

Have fun buying back 4x the exposure in NFT from the marketplace which can't be copied, can be kicked or manipulated. What's even worse is if GME decides to give out dividends in the future in the form of NFT instead of cash dividends. Imagine a lifetime of NFT dividends that shorts have to buy back and can't copy or can kick x 4 exposure thanks to splidividend.

The stock dividend was never going to squash the shorts. It was to begin the process to roll out the marketplace and increase their share count exposure so you can follow it up with even more dividends in the form of a non fungible tokens.

RC is playing 69D chess while hedgies are attempting to play 3d chess and melters are playing checkers.

GME board of directors just increased the share count exposure by 4x. The value of the short is unchanged because the price has been adjusted but when shorts have to buy up 4x the NFT every time GME releases a NFT dividend / split you will see fir3works like Larry Cheng mentioned.

TL;DR: Buy, Hold, Shop and DRS.
