Body:

Stop posting about NFTs if you don't understand how they work.

Stop posting anything FooBar tweets trying to link it to GME.

If you post about NFTs include facts to back up your point as most posts I'm seeing are just blatantly misleading. I don't think it's a fud campaign, I think it's apes who just don't understand what they are posting and it's spreading a lot of misinformation and false hope.

If you want to post about nfts spend some time doing some research on how they work.

While an NFT platform is going to take the company to the forefront of gaming and tech, GameStop isn't building an nft platform to issue a dividend. Sure it would be cool and maybe it'll happen but apes do not need a dividend to moass. Stop the obsessing and tinfoil hat theories.

The only thing we know about an nft dividend is it will likely (edited from 100% - sorry don't know how to strike out the text) lead to a drawn out legal battle (see overstock) which is part of the reason I don't think it's coming. GME could issue a form of crypto token which is much different than an nft but likely to result in lawsuit nonetheless.

I'd love to be wrong on this. I'm hyped 24/7 and I believe the moass is near, I'm prepared to hold my shares as long as I have to.

Take a deep breath and trust in RC and the team he is assembling and the process. The moass is coming. the moass does not need an nft dividend.

Edit 1 - the reason I don't believe an nft is likely is because it's complicated, expensive, and not the best use of GameStop's funds when they are looking to transform the business. To do a nft on the ethereum blockchain every stockholder would need to have a eth wallet to send the nft to. While it's an easy process to set this up, expecting potentially millions of stockholder to set that up, or coming up with a workaround would be time consuming and expensive and not in the best interest of GameStop as a company. Spending that time on a nft platform sounds like a better use of resources.

Separate from that, minting and sending 70+ million nfts would, on its own cost an insane amount of money (potentially hundreds of millions of dollars based on eth mining/gas fees). Again, not the best use of GameStop's capital when they are trying to transform the business.

A token that can be used on the GameStop nft platform to potentially buy digital used games, etc would make sense but again, the logistics behind that and trying to distribute those would be a really challenging logistical situation and highly likely to end in legal action against the company. Even the risk of that makes it a suspect move when looking at what's in the company's best interest.
