A couple of days before the Yahoo data went a bit...odd...Fidelity showed a sudden increase of shares available to borrow. If I recall, they went from around 788k to 4.5 million. That gives a ratio of around 3.54 to 1.

The Yahoo current float of 249.51m (I'm in U.K.) divided by 3.54 is 70.48mn, which is pretty damned close to the implied shares outstanding of 69.38mn.

Any likely correlation between these?
