I remember a while ago probably back in May there was a very informative post showing benford's law of large numbers on GME and comparing it with fiskars and other non manipulated stocks. I was curious if anyone knows if there is a script (maybe python?) that does this benford calculation. I'd like to run the numbers since may till now and see how much worse benford's law shows about gme.

It might be cool to make a website that updates EOD each day with the benford's law calc.
