Once I realized this I looked up how quantum physics pertains to the stock market and this is what I found "Traditionally, a quantum harmonic oscillator model is used to describe the tiny vibrations in a diatomic molecule, but the description is also universal in the sense that it can be extended to a variety of other situations in physics and beyond. One example of this is illustrated in a new study, in which researchers show that the restoring force in a vibrating quantum harmonic oscillator provides a good approximation of the market force that restores a fluctuating stock return to equilibrium" I also found this "Over the past several years, it has become more common to analyze the dynamics of stock prices by using quantum physics models". So then I ask myself did it start becoming "more common" because people just started to realize it's similarities. Or is it because the stock market has changed so new strategies become prevalent. If it's option number 2 I ask the question why is quantum physics now more prevalent in the market then 50 years ago? Is it because investment firms hire quantum physicist when creating algorithms. The same algorithms the 10% use that own 89% of the stock market therefore 89% of the stock market is controlled by an algorithm that was designed by a quantum physicist. Therefore you'd have to understand quantum physics if you want to win the game they created. Which luckily for me I joined a sub Reddit with a couple people who do that know how to explain it in simpleton terms enough to where now I believe I know quantum physics (I probably don't). But damn our financial market is built on a live experiment ran by quantum physicist that's designed it to keep the rich on top and to be so complicated you have to understand fucking quantum physics to know how it works
