On Friday 3/17 Gamestop had their Q4 earnings which was bullish as hell. But on the WSB sub there was a live discussion hosted by the mods where they brought bulls and bears to speak on their reasons for both sides. Unfortunately you retards proved to be too smooth brained. From an objective point of view the bears got the edge, mostly because you retards do not know how to argue good points. We had the one girl who was high as a kite and couldn't speak properly which makes us look even more stupid. It's clear most of you "read" the DD but do not actually comprehend and understand it. As you can't present it in your own words for others to understand, yet even when you can, they'll disregard you as a conspiracy theorist. I wanted to make this post so any retard can know exactly what to say when talking about GME and not looking stupid. I used to think the squeeze was over until these realizations came to me and I became a believer:

1. January 2021's price action was not a short squeeze. You should all screenshot and save the SEC filing on your phones or somewhere handy where they state the rise in price was not due to shorts covering but positive buying sentiment. Then show it to the person you are arguing and watch as their face changes into confusion and you start to dismantle their argument. Because if that was not a squeeze then you can rationalize that "a real squeeze" is still on the table. We know from that same report that GME's short % is at the very least 113%. Comparing this % alone to other squeezes of the past will easily show that if there was a squeeze when covering would be higher as the short interest was higher than even Volkswagen.

2. There was a few proclaimed financial retards who claimed that the price action of GME doesn't make sense. They are right, it doesn't. I have not seen one person ask or talk about the cycles of run up. All we have to do is have these patagonia shits open their trading apps and check why it is that predictably in 2021 there were run ups every 3 months. *If shorts covered*- (they didn't) check premise 1, then what could cause their cycle of run ups? We know the majority of share holders have shares besides some change to throw in options once in a while (which we only learn to stop doing) so retail does not have money to cause such spikes, then why? It must be the hedgies' doing, what exactly it is and why it stopped this year (so far) in 2022 is yet to be known.

3. OpenSea is trash and on February 2022 had an attack which led to NFT's being stolen. Yet this shit company is still valued at ~13B. (I'm not sure if this attack has negatively affected that evaluation) yet we can surmise that GME coming out with their own market place will let's say for conservative measure would add the value of 10B (It'll be worth more). Not to mention that they will allow for blockchain gaming as well, not solely just an NFT platform but gaming which is a 198 Billion market evaluation in 2021. Adding that evaluation to the current price

as of today 3/19/22, the company would be worth ~18 Billion which would make the stock alone worth slightly above \$200 USD. Gamestop has hired hundreds if not thousands of developers to reach this goal of becoming a tech company and that's bullish AF.

4. GME's board is stacked. The most notable example is Matt Furlong the current CEO. He was an associate director for Proctor & Gamble focused on brand, marketing, and sales. Then went on to Amazon for nearly 9 years as country leader for Amazon's Australia branch and Technical Advisor to the North American branch. His pay will be 200K/ year salary but will also receive compensation in stock. 200K/year is what software engineers make that's nothing for a CEO.

Sound familiar? Sound like Elon Musk's contract before TESLA popped? They also got Mike Recupero who was with Amazon for 17 years and worked to be VP of finance & CFO. Last example they also brought in Matt Francis from Amazon who was Engineering Leader for

Amazon Web Services. Now let's ask yourselves, why people from the one of the most valued companies in the world would leave their current position to come to a dying brick and mortar meme stock company,

unless Ryan Cohen whispered the greatest tale since the snake lied to Eve. What could he have possibly said to lure them? I want to find out, but more importantly experience it first hand as a share holder. With just being associated with Amazon they could have walked into any comfy top 100 fortune 500 company but they decided to come to Gamestop. FUCKING BULLISH.

5. DRS. It is illegal to promote DRS so they have been sneaking DRS numbers into their reports. We know the actual number has grown to basically 9 Million registered shares which cannot be fucked with. The math so far is that at least 25% of the float is locked. That's fucking bullish. This is akin to the average investor personally doing a share buy back on the behalf of the company. This is fucking huge. You have the most devoted group of smooth brains who can't even talk properly buying at any given price. This has never been seen before and alone is a great indicator. It means it's working.

6. Lastly is insider selling. THERE IS NONE. As an investor the strongest sentiment in company confidence is clustered group buying from insiders. No one who has joined has sold ANY shares since joining through the run-ups. They are down 50% on their investment and stil have not wavered this is fucking great. They know the mission and come back will be worth holding on to and we should hold along as well. (In the spirit of transparency the EX-CEO of gamestop Sherman George did sell his shares but we don't count him as a real insider as he was fired and does not represent the brand or it's mission.)

TRDR: Gamestop to the moon whether shqueeze or no shqueeze. Buckle-up Kiddos. No time Frame.
DRS. Not Financial Advice. I like the stock. To be fair there are other good arguments and DD's as well, but for the nature and ease of relaying a message to the common person I think these basic points are the easiest to understand.
