So, I am looking at Amazon this morning, as it goes from 2400+ per share to 122 per share on their 20 for 1 split, and my first thought is "Gee, I wonder how the hell the options chain would handle that?"

It's obviously pre-market, but it's safe to say, none of the data makes any sense.

If I bought a call @\$2500 for \$50, I paid \$5000 for the right to 100 shares. Do I now have 20 calls at \$125 for \$2.50?

What happens to the options chain in a split? Could this be the GameStop plan?
