personally i dont subscribe to options due to budget reasons, and i ESPECIALLY dont like the idea of being anti-drs, but i feel like i for sure saw a fool proof DD about executing long term options and then DRSing the shares immediately after. not only did it combine these opposing views but it actually had a tenfold effect on locking the float a lot faster BECAUSE of the combination. i may very well be misremembering and generalizing this but if that theory is true it is crucial we dont overlook this if it hadnt been debunked.

this is my first post in any of the gme subs so i apologize if i missed something, but wanted to see if anybody remembers this incase we overlook it due to abolishing gherks theory
