Step 1 - Be a broker

Step 2 - have 100 shareholders/customers owning 1 share of gme each.

Step 3 - lend out 90% of all gme shares for a fee, you now have 10 shares for liquidity.

Step 4 - 4 to 1 stock split announcement, receive 3 shares for every share owned.

Step 5 - figure out how to give 300 additional shares to shareholders if you only receive 30 from Gamestop.

Step 6 - raise stock borrow fee to get stock returned from short sellers before split date.

Step 7 - call short sellers asking for shares back.

Step 8 - cry when they don't pick up the phone.

Step 9 - panic that you only got an additional 10 shares before the split. (20 shares out of 100)

Step 10 - stock splits, receive 60 shares from gamestop when you actually needed 300 to distribute to your customers (you have 80 shares in total now but should have 400)

Step 11 - panic, cook the books. Fake the numbers in your customer accounts.

Step 12 - watch short sellers default on your GME borrow fee, start seeing their names in the news about bankruptcy.

Step 13 - pretend everything is fine, you can't afford to buy real shares for your customers on the open market anyway.

Step 14 - Customers start DRS process with you, allow 80 shares worth of DRSing

Step 15 - refuse anymore DRS requests, lawyer up.

Step 16 - wait for litigation lawyers to force your hand.

Step 17 - file for bankruptcy and liquidate ALL customer accounts as permitted by your trading policy so they get the cash value of their shares without ever buying the 320 shares on the open market that you owed to customers, suppressing the price of GME by 320 shares worth of demand. (You only had 80 real shares which were DRS'd)

Now imagine this scenario but with 10s of millions of shares.

Don't be square, DRS your share.
