The only way to get an advantage in the stock market is to have data that others don't have. Why wouldn't everyone be manipulating there short%, FTDs, synthetic shares, etc? I think this goes much broader than \$GME as well. Who is the entity ensuring counterfeit shares aren't being created and sold? How do you know you bought real shares?

For dollars there is the US Treasury and Federal Reserve, not that they are perfect either but at least have the ultimate authority. Who is the equivalent for equities? DRS is the way to show how bad this has gotten with \$GME but I think it will become a much bigger problem.

This is where blockchain would be a perfect system for trading equities. All trades are observable on the ledger. No way to cheat the system.

Why aren't all trades required to be through an exchange? This seems like an easy way to prevent these problems.

TLDR: I believe there are counterfeit shares, DRS is the way, other stinks will follow!
