Is\_self: True

Gamestop is well positioned to capitalize on another cool emerging technology related to NFTs: webassembly.

Webassembly, commonly referred to as wasm, is a browser runtime that allows for running full games in the browser at near native performance. This means that it is a really well suited delivery mechanism for games.

It is my understanding that most games should run in wasm with some modifications. But, do you know what else runs in wasm? Smart contracts like NFTs! Gamestop engineers could draw on their NFT expertise when developing a wasm game portal!
