1. I just wanted some more context on the premise that a market crash would leave SHFs unable to meet margin requirements because I would imagine (this info is probably visible in old 13Fs or something) that many long positions at SHFs were bought so long ago that equities would have lose like 80% of their value for them to actually be at a loss based on their entry points. I'm guessing this has something to do with them over-levering themselves and in need of deep collateral accounts.
2. Also, what are ways in which SHFs play taxes such that they exit positions without enormous burden? I ask because there are ETFs like A-r-k(s) that seemingly buy a thing, live the hype, and then liquidate it 3 months later and then buy it again and keep repeating this? Do hedge (I know a-r-k is not a hedge fund) funds even pay taxes?
