It has been a year since I started researching and writing articles on various aspects of decentralization, value creation, cryptocurrencies, and a decentralized Metaverse. I have met so many good debaters over my articles, who have raised questions from different angles, and so many philosophers, who have guided me through their point of view. And then, there are always some non-believers, who have showered their utmost hatred towards the topics mentioned above. I am not talking about those who have criticized our articles, or our decentralized project - because criticism makes you learn better. This article is for those who have stated that they hate those topics, as those topics are just vapourware, buzzwords, and jargon - and they can't exist in any way.

First of all, let us talk about decentralization. Decentralization was never a vague hypothesis. The day society started thinking of something bigger than themselves, i.e, the fundamental rights of an individual irrespective of caste, creed, race, and religion - they started talking of decentralization. Democracy itself is a form of decentralization in the governance sector. And it marks the day the modern era started.

Decentralization in the finance sector was tough to even comprehend before Satoshi Nakamoto came up with Bitcoin. Despite having numerous flaws, it was certainly pathbreaking work. Blockchain technology created the hope of decentralization in the finance space - something which couldn't even be considered possible earlier. Even though it is still in its childhood, Blockchain technology is upgrading itself every hour. And the more the number of decentralized projects come into reality, the more blockchain protocols will be developed. As the proof of work and proof of stake concepts, Tiluf is working on a concept called the proof of reality (we will explain this in another article at the right time), which will help make the speed of transactions exponentially faster with a minimal fee inside a decentralized Metaverse. Here, I'd like to pop in a bit of information that I think you should know: Tiluf is the only blockchain network that is completely dedicated to the metaverse.

People who have denied the possibility of the existence of the Metaverse, have somehow forgotten or overlooked the technological development of AR and VR. Both of these technologies are astonishing people with their capabilities. The interaction and immersive nature of AR & VR can clear any doubt about the existence of Metaverse in the future. What does it take to make a social space? People, interactions, talking and sharing, and trading! Nothing more is needed. And when a decentralized Metaverse is in the making, the trading and other finance stuff come through the blockchain. So, having a blockchain network running inside a Metaverse solves the problem of trading and payments. AR and VR take care of the rest!

Tiluf is a blockchain network which allows users to create their own Metaverse and their own crypto-economy around it. But the fun part is a paradox. It's called the paradox of fiction:

>We can be afraid of something that does not in fact exist, but it seems we must at least believe it exists. Again, we cannot hate or love anything unless we believe it exists. But we also have emotional responses to fiction: we can be afraid of a fictional criminal in a film or feel vengeful when fictional injustice is perpetrated, and in these cases, we know the objects of our emotions do not exist.

Now, if the non-believers don't believe in the existence of the decentralization, the Metaverse, or the decentralized Metaverse - how can they hate them - unless they believe in its existence or the possibility of its existence in the future! We don't want to pressurise anyone into believing those words. Our project Tiluf is not just a hypothesis. It has already come into existence and working in its beta form. Those who aren't ready to believe it are welcome to check out the app, and then make the judgment for themselves.

Our philosophy is to decentralize the Metaverse space, and we are on it! Now, it is up to you, whether you want to be on this ride with us - or not!
