Title: The YF "glitch" is less a crack in the SHF facade and more a play to keep the fuckery going

UPDATE: The float has changed again! It is now 62M, and if it holds, the premise of this post is wrong. It could be the change had to do with simply the futures swaps not rolling over last week. However I'll leave the post up in the event anything else happens. For now, disregard this discussion.

First, let me just say I am hyped about the new info as much as the next ape, but no one is truly sure what the meaning of this change in float number is. A lot of possible reasons as to how this has happened, and u/gherkinit has much to say on the matter. However, it seems odd the MMs have chosen to let this change happen. This post is total speculation. Hence the flair I added. Sorry if this comes off as FUD, I am a simpleton with a brain like a cueball, without enough karma to post to Superstonk yet. I am open to any suggestion or input as to the positive implications of this.

Now for what I meant to flesh out. Computershare. There has been a lot of momentum in the community to begin purchasing real shares that circumvent the order execution nonsense revolving around Citadel and the DTCC. This is what we in bird culture call a big dick move.

My speculation begins with the idea that this approach to putting 100% of 50M shares in accounts that have no obligation to lend is entirely plausible, from the view of the establishment. No lending means no MM fuckery. MOASS.

They have now quadrupled the float in order to maintain a share number that allows them to continue their normal stock manipulations. We began to break their game, and they pulled new fuckery. Of course the float is wrong. It was wrong at 50M, and it's wrong at 249M now. This isn't float anchoring. This is a new kind of tree shaking, while providing headroom for continuing to perform naked shorting, swaps, DOOMPs, etc. I am willing to bet every time we get close to attaining 100% the float via DRS, the more shares they will "glitch" into the exchanges.

Again, this is all sepculation, and I am willing to be proven wrong. I love you apes. Keep using Computershare, and keep HODLing.
