What the other posts are trying to say is, gme pre split 1 share = 1 share in CS. Unless that's not how it works.

After split, 1 real share + 3 fakes given. (Non cs). Hence 4x times easier. CS only counts real shares. So fill the bag with synthetic shares = converts to real shares.

Next we find out how synthetics are made out of nothing.

(Finding out how synthetics are made after)

Us: Use computershare, enemy is confused

Hedgefunds: Hurts itself in its confused state. Target is now paralyzed, can't move. (Close puts)
