⌄ What is Layer 2?

Layer 2 (L2) refers to a set of protocols that sit above a blockchain, and that are tightly attached to the base network (Layer 1). It is typically used for apps that require faster speeds and lower transaction fees than the underlying blockchain. Importantly, Layer 2 derives its security from the base network, like Ethereum. Currently, GameStop NFT supports Loopring L2, and will support the ImmutableX L2 in the near future.
